

Climate Guidelines of Siebfabrik Arthur Maurer GmbH & Co. KG

Climate change is one of the greatest challenges of the 21st century. We want to address these new challenges and position the sieve factory for the future and competitiveness. To this end, we are creating a climate footprint, deriving measures to reduce emissions, and gradually implementing them.

In doing so, we act according to the principle of "Prevention before Reduction before Compensation."

Continuous Improvement

We strive for continuous improvement by regularly updating and analyzing our greenhouse gas footprint, as well as deriving and implementing appropriate measures to reduce our emissions.

Collecting Emissions Data

In the first step, we determined which emissions occur in our company. A distinction is made between

Scope 1 emissions (direct emissions from the use of primary energy sources or from production processes),

Scope 2 emissions (indirect emissions from energy procurement), and

Scope 3 emissions (other indirect emissions from upstream and downstream activities).

Furthermore, as part of a materiality analysis, we determined which other indirect emissions from upstream and downstream activities (Scope 3) should be included in the balance sheet boundaries. We update our greenhouse gas balance annually in accordance with our reporting framework. We continuously add further Scope 3 emissions to our greenhouse gas balance sheet, in accordance with the principle of completeness.

Making procurement more climate-friendly

Through consciously climate-friendly and energy-efficient purchasing, our greenhouse gas emissions can be reduced and sustainability can be strengthened at the same time. By using regional products and climate-friendly alternative products, where possible and economically viable, we also achieve a reduction in emissions.

Informing and involving employees

We achieve successful climate protection through the involvement of management and the active participation of all employees. Therefore, we inform our employees so well that they can actively assume shared responsibility and climate protection is actively "lived" in our company.
